Description: Who doesn't love the soft glow of electroluminescence? This EL tape is a flexible plastic ribbon which contains a phosphor layer and lights up with a neon-like glow when the proper voltage is applied. It's a lot like the ever-popular EL wire except, well, it's a ribbon.

These can be driven with any of the EL inverters and sequencers that we carry and come in a variety of bright colors (check below for other colors). This particular ribbon is 1 meter long, 15mm wide and illuminates blue. It is attached to a 20cm cable which is terminated with a JST PH connector.

Dimensions: 1m long, 15mm wide
